

As radiology groups merged into sophisticated enterprise systems, the Medicalis' Professional Solution delivers a single, unified workflow across your business.

**PRODUCTIVITY**

**Single Enterprise Worklist** - Every study across the enterprise is now available to physicians, and the information in RIS/PACS is instantly at your fingertips.

**Image Federation** - Medicalis' imaging federation technology not only delivers the flexibility of making images available to any workstation, but also provides the benefit of opening the most appropriate PACS display from a single workstation.

**Patient Summary** - Medicalis' Professional unifies patients' relevant clinical data such as allergies, labs, pathology reports, faxed/scanned documents, and imaging priors, across EMR systems thus eliminating the context switching costs of your radiologists.

**Dynamic Work Distribution** - Medicalis' work distribution engine assigns studies to radiologists based on sub-specialty, RVU measured workload, and expected turnaround time. Worklists are continually monitored assuring the right volume of studies are done by the right radiologist at the right time.

**Actionable Reporting** - Medicalis reporting validates results in real time to reduce physician parroting, ensures fiscal and quality compliance (e.g. PQRI) and triggers critical findings entirely via voice recognition.

**QUALITY**

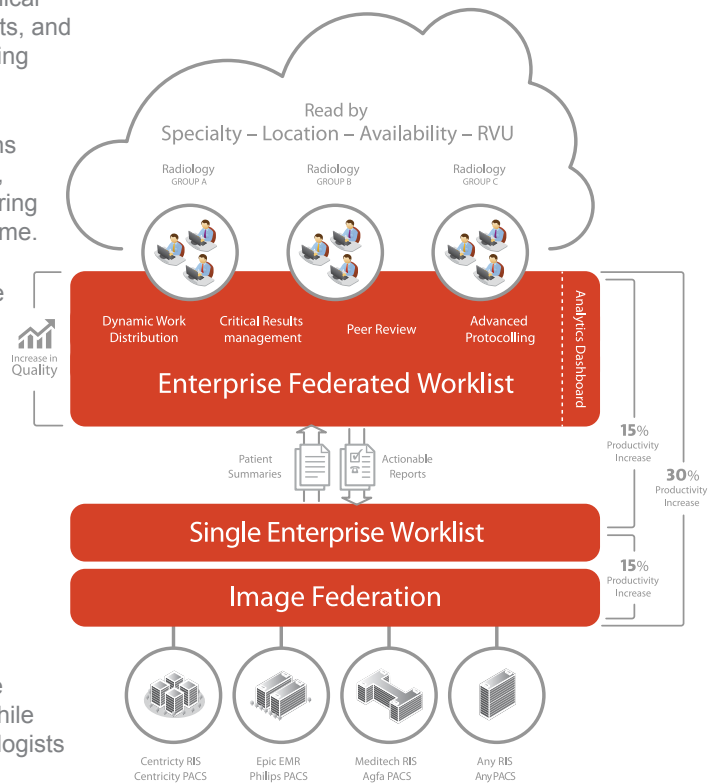

**Critical Results Management** - Medicalis' Professional automates delivery, notification, documentation and management of critical test results via a close-loop escalation and notification grading mechanism.

**Peer Review** - Seamless implement peer review into your organization without compromising productivity.

**Advanced Protocolling** - Answer the questions referring physicians are asking within an accountable, transparent, and standardized process, while clearly documenting and communicating the specific protocol for technologists to use at the time of image acquisition.

**Analytics and Reporting**

Medicalis Analytics Portal is an enterprise tool for data analysis that consolidates multiple RIS, HIS and PACS data providing executives, business managers, and key operational personnel with insightful Business Intelligence.
